Practice Final Correction

```
class Race{
2
            public static final int MAX = 5;
3
            public static final int MIN = 1;
4
5
            private static int data=Race.MIN;
6
            public static int getData(){
7
                     return data;
8
            public static void incData() {
9
                     if (data < Race.MAX)
10
11
                             data++;
12
            public static void foo() throws Exception{
13
14
                     while (data < Race.MAX)
15
                             incData();
            }
16
17
18
19
   public class Car implements Runnable {
            public void run(){
20
21
                     Race.foo();
^{22}
            public static void main(String[] args) throws Exception{
23
                     Thread t1 = new Thread(new Car());
24
^{25}
                     Thread t2 = new Thread(new Car());
                     t1.start();
26
27
                     t2.start();
28
                     t1.join();
29
                     t2.join();
30
                     System.out.println(Race.getData());
31
            }
32
```

- 1. In the above code, where might be race condition(s) occur? Speciafically which line(s) of the code?
- 2. Where and how should the race condition(s) be prevented?
- 3. What is a deadlock? Can one occur in the above code ever? Why or why not?

```
class Examine{
             static int[] data = new int[10];
public static void dance(int value){
2
3
4
                       int i=0;
5
                       \verb|while(i<data.length)| \{
6
                                for(int j=0; j<100; j++);
7
                                          data[i] = value;
8
9
10
              static Runnable launch(int id){
11
                       return new Runnable(){
12
                                public void run(){
13
                                          dance(id);
14
15
             }
16
             public static void main(String[] args){
17
                       Thread t1 = new Thread(launch(1));
18
                       Thread t2 = new Thread(launch(2));
19
                       t1.start();
20
                       t2.start();
21
                       t1.join();
22
                       t2.join();
23
             }
^{24}
```

- 4. In the above code is there a race condition? If yes, what is the race condition and where exactly is it (demonstrate the race via code walk thru)?
- 5. Would the code when run cause an Exception?

```
class Grain {
2
            public String toString() { return "Grain"; }
3
4
5
    class Wheat extends Grain {
6
            public String toString() { return "Wheat"; }
7
8
   class Mill \{
            Grain process() { return new Grain(); }
9
10
    class WheatMill extends Mill {
11
12
            Wheat process() { return new Wheat(); }
13
   public class CovariantReturn {
14
15
            public static void main(String[] args) {
                    Mill m = new Mill();
16
                    Grain g = m.process();
17
                    System.out.println(g);
18
                    m = new WheatMill();
19
20
                    g = m.process();
                    System.out.println(g);
21
            }
^{22}
23
```

6. Is the method "process()" in WheatMill in error?

```
class Egg2 {
                   protected class Yolk {
          public Yolk() { print("Egg2.Yolk()"); }
          public void f() { print("Egg2.Yolk.f()");}
 2
 3
 4
 5
                    }
                    private Yolk y = new Yolk();
public Egg2() { print("New Egg2()"); }
 6
 7
                    public void insertYolk(Yolk yy) { y = yy; }
 8
 9
                    public void g() { y.f(); }
10
11
     public class BigEgg2 extends Egg2 {
    public class Yolk extends Egg2.Yolk {
        public Yolk() { print("BigEgg2.Yolk()"); }
        public void f() { print("BigEgg2.Yolk.f()"); }
12
13
14
15
16
17
                    public BigEgg2() { insertYolk(new Yolk()); }
                    public static void main(String[] args) {
        Egg2 e2 = new BigEgg2();
18
19
20
                                  e2.g();
21
                    }
     }
^{22}
```

7. Give the output for the above:

```
class Parcel4 {
             private class PContents implements Contents { private \ int \ i \ = \ 11;
2
3
4
                      public int value() { return i; }
5
             }
6
             protected class PDestination implements Destination \{
7
                      private String label;
8
                      private PDestination(String whereTo) {
9
                               label = whereTo;
10
                      public String readLabel() { return label; }
11
12
             public Destination destination(String s) {
13
14
                      return new PDestination(s);
15
16
             public Contents contents() {
17
                      return new PContents();
18
19
20
   public class TestParcel {
21
             public static void main(String[] args) {
                      Parcel4 p = new Parcel4();
Contents c = p.contents();
22
23
                      Destination d = p.destination("Tasmania");
^{24}
25
                      Parcel 4. PContents pc = p.new PContents(); // ERROR
26
             }
    }
27
```

8. The above class has an error on the line indicated. Explain why there is an error.

```
public class Wrapping {
2
            private int i;
3
            public Wrapping(int x) { i = x; }
4
            public int value() { return i; }
5
   }
6
7
   public class Parcel {
8
            public Wrapping wrapping(int x) {
9
            //return an anonymous inner class object of Wrapping type
            //with overloaded method "public int value (){ return 47*i;}"
10
11
12
            public static void main(String[] args) {
                    Parcel p = new Parcel();
13
                    Wrapping w = p.wrapping(10);
14
15
            }
16
```

9. In the above classes provide the missing code.

- 10. Given an ArryList is-a List and a List is-a Collection is the following true? ArrayList<String> is-a Collection<String>
- 11. Given interface FooBar<X,Y> extends Silly<X> which of the following ARE subtypes of Silly<String>?
 - (a) FooBar<String, String>
 - (b) FooBar < String, Integer >
 - (c) FooBar<Integer, String>
 - (d) FooBar<String, Exception>
 - (e) FooBar<Integer, Integer>
 - (f) FooBar<Exception, Integer>
- 12. Given

```
static <T>T pick(T a, T b)return b
```

Is the following an error or not? If an error, explain why, if not give the return type.

Collection c = pick(new Set<String>(), new Stack<String>());

13. If the code below gives an error explain why, if not explain why.

```
public static void addNumbers(List<? super Integer > list){
            for (int i=1; i<10; i++){
                list.add(i);
            }
}
// in other code:
addNumbers(new ArrayList<Number>());
```

14. If the code below gives an error explain why, if not explain why.

```
void swapFirst(List<? extends Number>listA, List<? extends Number> listB){
            Number temp = listA.get(0);
            listA.set(0,listB.get(0));
            listB.set(0,temp);
}
```

```
1
    class Example{
2
            public void open() throws FileNotFoundException{
3
                    System.out.println("attempting to open file");
4
                    throw new FileNotFoundException();
5
6
            public void close() throws CloseException {
7
                    System.out.println("attempting to close file");
8
                    throw new CloseException();
9
10
            public static void main(String[] args) throws Exception{
                    Example e = new Example();
11
12
                    try{
13
                             e.open();
                             System.out.println("after opening file");
14
15
                    }finally{
16
                             System.out.println("finally");
17
                             e.close();
18
                             System.out.println("after closing file");
                    }
19
20
            System.out.println("end of program");
21
   }
22
```

15. Give the output. State any exception(s) that are displayed on exit.

```
class LanguageException extends Exception{}
            class JavaException extends LanguageException{}
public class Test {
2
3
4
                     public void a() throws LanguageException{
5
                              throw new LanguageException();
6
7
            public void b() throws JavaException{
8
                     throw new JavaException();
9
            public static void main(String[] args){
10
11
                     Test t = new Test();
12
                     try{
13
                              t.a();
14
                              t.b();
15
16
                     catch(LanguageException 1){}
17
                     catch(JavaException j){}
18
                     System.out.println("finished main");
            }
19
20
```

16. Give the output. State any exception(s) that are displayed on exit.

```
public class Out {
            int x;
3
            static class In {
4
                    public void setX(int value){
5
                             x = value;
6
7
            }
8
            public static void main(String[] args){
9
                     //your code goes here
10
            }
11
```

- 17. What is the error in the above class? Why?
- 18. Give the code to create an "In" object in main()

```
class Cat {
2
             Kitten k = new Kitten();
3
             public Cat(){
                     System.out.println("cat");
4
5
6
             {\tt class\ Kitten}\{
                     public Kitten(){
7
8
                              System.out.println("kitten");
9
            }
10
11
   public class Lion extends Cat {
12
            public Lion(){
13
                     System.out.println("Lion");
14
15
            }
16
             class Kitten {
17
                     public Kitten(){
18
                              System.out.println("young Lion");
19
20
            }
            public static void main(String[] args){
21
22
                     new Lion();
23
^{24}
```

19. Give the output

```
class Cat {
2
            Kitten k;
3
            public Cat(){
4
                     System.out.println("cat");
            }
5
6
            class Kitten{
                     public Kitten(){
7
                              System.out.println("kitten");
8
9
            }
10
11
            public void produce(Kitten kk){
12
                     k = kk;
            }
13
14
15
   public class Lion extends Cat {
16
            public Lion(){
17
                     System.out.println("Lion");
18
                     produce(new Kitten());
19
            }
20
            class Kitten {
                     public Kitten(){
21
^{22}
                              System.out.println("young Lion");
23
24
            }
25
            public static void main(String[] args){
26
                     new Lion();
            }
^{27}
28
```

20. Give the output or if there Is an error, fix it and give the output.

```
class A {
2
             private int x;
3
             public void setZ(int zz){
4
                       z = zz;
5
             }
6
             {\tt class} \ {\tt B}\{
7
                      private int y;
8
                       class C{
                                private int z;
9
10
                                public void setX(int xx){
11
                                         x = xx;
12
13
                      }
             }
14
15
    }
```

21. Examine the code above. Is there an error? If so what is the error and why? If not, explain

```
1
   class A{
2
            class B{
3
                     class C{}
4
            }
5
            public static void main(String[] args){
6
                     //code
7
            }
8
   }
```

22. Give the code necessary to create a C object in main()

```
1
   class X {
2
           int z = 5;
3
           static class Y\{
4
                    public int getZ(){return z;}
5
           }
6
           public static void main(String[] args){
7
                    //code
8
           }
```

- 23. What is the an error in the code above?
- 24. If the error was removed in the above code, give the code to create a Y object

```
1
   class X{
2
            int y;
3
            public void foo(){
4
                    for(int i=0; i<10; i++){
5
                             if (y < 5)
6
                                      y++;
7
                    }
8
            }
9
   }
```

25. For the above code give the places where a race condition exists.

```
1
    class A implements Runnable {
2
             ReentrantLock lock = new ReentrantLock();
            List s ;
3
4
             public A(List store){
5
                     s = store;
6
7
            public void run(){
8
                     for(int i=0;i<10; i++){
9
                              if(lock.trylock())
10
                                       s.add(i);
11
                     }
            }
12
13
   }
14
15
    {\tt class\ B\ implements\ Runnable}\{
16
            ReentrantLock lock = new ReentrantLock();
            List s;
17
18
            public B(List store){
19
                     s = store;
            }
20
21
            public void run(){
                      for(int x = 20; x<30; x++){
22
^{23}
                              if(lock.tryLock())
                                       s.add(x);
^{24}
                     }
25
^{26}
            }
27
    public class Test {
28
^{29}
            public static void main(String[] args){
30
                     List store = new LinkedList();
                      A a = new A(store);
31
32
                     B b = new B(store);
33
                     new Thread(a).start();
34
                     new Thread(b).start();
35
                     Thread.sleep(2000);
            }
36
37
    }
```

26. Does the above code protect the shared List? Why or why not?

27. Write the above using a Lambda expression

```
public class Table{
             enum TYPE {MULT, ADD}
2
3
             public void display(int start, int end, TYPE t){
4
                      for (int i = start; i < end; i++) {</pre>
                                for (int j = start; j <end; j++){
    if (t == TYPE.MULT)</pre>
5
6
7
                                                  System.out.printf("%3d ",(i*j));
8
                                         else
9
                                                   System.out.printf("%3d ",(i+j));
10
                                System.out.println("");
11
12
             }
13
             public static void main(String[] args){
14
15
                      Table t = new Table();
16
                      t.display(1,10,TYPE.MULT);
             }
17
18
    }
```

28. Modify to use a Lambda expression and give the expression to get the same output as the code above with your new display() method.
